The Channel Tunnel Rail Link is a project that required a lot of planning and coordination. The northwest platform of the London Underground's Waterloo station was the site of the work. The platform was extended by 100m and the construction of a new track was necessary to accommodate the new trains. The new track was constructed using advanced technology and materials to ensure durability and safety. The work was completed in time for the launch of the new trains. The project was a significant milestone in the expansion of the London Underground network.
